

# Ideation Phase

## Empathize & Discover

The **Empathize & Discover** phase focuses on understanding the challenges faced by users in analyzing agricultural data. Farmers, researchers, and policymakers require accurate information to make better agricultural decisions. However, agricultural production data is large and difficult to interpret in its raw format. It is challenging to identify crop production trends, state-wise performance, and seasonal variations through manual analysis. Therefore, there is a need for an interactive visualization system that presents data in a simple and meaningful way. This project, **India's Agricultural Crop Production Analysis (1997–2021)**, uses Tableau dashboards to transform raw data into clear visual insights. These insights support better planning, monitoring, and decision-making in the agricultural sector.
